

**Sepsis** is a serious medical crisis caused by a severe systemic inflammatory response to infection, which often results in **organ dysfunction** and may lead to **septic shock** or **death**.

Sepsis

**Aim:** Find physiological modifiers that influence phenotypes and outcomes of systemic inflammation

# Diet-derived eicosanoids and phenotypes in sepsis

HRZZ projekt UIP-2020-02-2476

**Hypothesis:** polyunsaturated fatty acid (PUFA) status (determined by dietary intake) potentially regulates responses to infection and may directly affect outcomes in sepsis.

Diet PUFA content

Plasma EICOSANOIDS content

Phenotype

Outcome
